VETSCAN® VS2 Hospital Resource Guide

Welcome to the VETSCAN® VS2 Hospital Resource Guide

This guide is designed to help make the VETSCAN VS2 Chemistry Analyzer indispensable for your veterinary clinic by covering the most common medical topics that are likely to arise in your practice. Throughout the chapters listed here, you will find links to supplemental resources to help address any questions you may have.

We hope you find this guide useful, and as always, contact Diagnostic Technical Support for further assistance at:

(800) 822-2947

The VETSCAN VS2 Chemistry Analyzer is a state-of-the-art chemistry, electrolyte, immunoassay and acid-base analyzer that delivers uncompromising performance.^{1,2} By using just 100 µL of whole blood, serum or plasma, the sophisticated Intelligent Quality Control (iQC) combines with proprietary algorithms to ensure dependable results during each run.* This feature frees staff from having to perform routine quality controls or calibration.^{3†}

clinical decisions for your patients.

VETSCAN VS2 Profiles

The reagent profiles are specially designed to perform all the steps required to convert just 100 µL of blood into a panel of test results.⁺ The VETSCAN VS2 rotor spins, separating the whole blood sample into plasma and cells. Precisely measured quantities of plasma or serum and diluent are mixed and delivered to the reaction cuvettes along the rotor perimeter. The diluted plasma dissolves the reagent beads, initiating the chemical reactions, which are monitored photometrically. The bar code printed on the rotor bar code ring provides calibration data that are specific for the chemistries in the rotor, ensuring accurate results.³

VETSCAN VS2 Rotor

Diluent container opens when the rotor is inserted in the analyzer. Do not hold here or inadvertently pierce.

Hold the rotor **by the sides only**.

Sample fill line is indicated by the 2 arrows on the rotor surface. The sample will form a line between the arrows when a sufficient sample is added (~100 μ L of sample).

*Always fill sample tube to the manufacturer's sample fill line.

⁺The routine use of quality controls is not required for optimal analyzer performance. Quality control material is available for the VETSCAN VS2 at the recommendation of Diagnostic Technical Support or upon request from Customer Service.

The VETSCAN VS2 provides dependable results with a sample integrity report, so you have all the information needed to make the best

Running a sample: adding a sample to a VETSCAN VS2 profile³

DO's

- Remove rotor pouch from the refrigerator immediately before testing—there is no warm-up time
- Use a fixed 100 μ L volume pipette
- Hold the rotors by the sides only, without touching the bar code or the central diluent container
- Keep the rotor in a flat position when loading in the VETSCAN VS2
- Avoid introducing air bubbles in the sample port
- If an air bubble is introduced, add enough sample to fill the overflow area 90 ul by 1/3 to 1/2, as shown here
 - > 90 µL < 120 µL > 120 µL
- Start each test within 10 minutes of transferring the sample into the rotor
- Consider testing plasma or serum:
- When there is the potential for insufficient plasma volume (eg, dehydrated patients, sight hounds)
- In very sick patients
- In animals who just ate a high-fat meal
- In dogs who are predisposed to hyperlipidemia (eg, miniature schnauzers)

DON'Ts

- Store rotors in the freezer
- Hold the rotor from the center
- Touch the pipette tip or a false elevation of amylase can result
- Use samples from EDTA tubes for any testing on the VETSCAN VS2
- Remove a sample from the rotor and try to reintroduce it to the rotor
- Apply excess blood to the sample port, as it may contaminate the analyzer (exception if air bubble present—see DO's)
- Spill blood on the bar code ring or rotor
- Run fluids other than whole blood, plasma or serum
- No other fluids are supported for use on the VETSCAN VS2

What is wet chemistry technology?⁷

Wet chemistry, or absorbance spectrophotometry, is the process by which a chemical reaction occurs, and then light is passed through a substance, and the amount of light absorbed is measured. Wet chemistry technology is used in reference and commercial laboratories as well as in the VETSCAN VS2 and is often considered the gold/ reference standard for biochemical analysis.

The value of Intelligent Quality Control (iQC)—reporting physical interference is better medicine

The VETSCAN VS2 incorporates a unique process called iQC. Transparent to the operator, iQC checks the analyzer, the rotor and the sample during every run to verify correct electronic and chemistry performance. iQC automatically suppresses a single chemistry or the entire panel if it detects uncharacteristic performance and immediately alerts the operator to any problems. iQC ensures that the operator receives only reliable results.^{2,8-9}

Intelligent Quality Control (iQC)

Automatic quality checks with iQC with every run for reliable results²

Quality Check

	Outcome / Benefit
Optics	Validates the performance of the optical components during run and guarantees the most accurate measurements.
Semperature	The temperature is controlled with heaters and fans to mai ideal reaction temperature of 37°C.
re/Software	Continual testing of software and hardware features verifie consistent and optimal performance of the analyzer.
Fluidics	Metering and movement of fluids are controlled at all stage analysis to ensure the presence of sufficient sample and dil reaction cuvettes.
Reagents •	Rotor type, expiration date and reagent calibration factors checked prior to every run. Time-consuming and error-pro calibrations are not required.
Sample	The analyzer evaluates the sample's quality and reports on results that are not influenced by interference (hemolysis, I and icterus). Minimizes the need for visual evaluation of t for physical interference.
istry quality control (QC)	Special QC reagent beads indicate any degradation of the specific reagents due to suboptimal storage conditions (egand temperature).
Chemistry >	The analyzer monitors the analyte-specific reactions and vertice that all measurements are within the expected range.

VETSCAN VS2 troubleshooting reports

VETSCAN VS2 sample evaluation

Built-in iQC evaluates sample quality and reports hemolysis, lipemia and icterus levels. iQC automatically suppresses a single chemistry analyte or the entire panel if uncharacteristic performance is detected.

Interpreting VETSCAN VS2 troubleshooting reports*

Troubleshooting reports provide technical information from the test run and may display an estimated value for a suppressed result.

Suppressed results must be interpreted with caution due to the impact of sample interference.

If suppressions occur, contact Diagnostic Technical Support for assistance in interpreting the troubleshooting report prior to collecting a new sample and/or sending the sample to a commercial laboratory.

Contact Diagnostic Technical Support for assistance with interpreting VETSCAN VS2 troubleshooting reports @ (800) 822-2947

dxsupport@zoetis.com

*For VETSCAN® FUSE and ZoetisDx users: cancellation and suppression troubleshooting data are not transmitted to the VETSCAN FUSE or ZoetisDx. Result suppression ("~~~") will show as "SUPP" when transmitted. To capture the troubleshooting data, either print the troubleshooting report from the VS2's printer or view it on the analyzer's screen.

What is sample interference?

Sample interferents are substances that affect blood chemistry results during analysis. Sample interferents can contribute to preanalytical and analytical errors. The VETSCAN VS2 iQC assesses the sample interferent levels—hemolysis (HEM), lipemia (LIP) and icterus (ICT) with every profile run.

sample quality is adversely affecting results

	Interference Index Solutio			
<section-header></section-header>	 HEMOLYSIS is the rupture or destruction of RBCs, which can occur in 2 ways: During or after blood collection (artifactual), MOST commonly due to: Inadequate venipuncture technique Lipemia effects on RBC membrane Freezing of whole blood samples Delayed processing In the circulating blood (in vivo) due to disease (less common) Eg, immune-mediated hemolytic anemia (IMHA) 	If artifactual hemolysis causes test re suppressed, collect a new sample wit technique and rerun the test.		
	 LIPEMIA is the milky appearance of serum or plasma caused by increased concentrations of triglyceride-carrying lipoproteins (fat). The most common reason for lipemia is that the patient has not been fasted (artifactual) 	 A whole blood sample may be centri (to obtain serum or plasma) and test a suppression may still occur. If LIP causes test results to be suppression may still occur. If LIP causes test results to be suppresented to fast the patient for collect a new sample and run the to collect a new sample and run the to commercial laboratory that has an if needed 		
	 ICTERUS is the excessively yellow pigmentation of the plasma or serum that suggests hyperbilirubinemia.³ Assess a sample visually for ICT, but the magnitude of hyperbilirubinemia should be confirmed with TBIL concentration 	 None, as ICT is NOT a sample handling a disease process. Contact Diagnostic Technical Suppointerpreting the troubleshooting results. Consider sending to a commercial may be able to process the high less the high l		

When sample interference is significant based on iQC, some results may be suppressed. This is not an example of a rotor failure. Rather, this is exactly what chemistry analyzers should do if an interfering substance and/or

esults to be th good

ifuged once ted; however,

Baseline chemistry profiles

When performing a health or preanesthetic screening or initially diagnosing a sick patient, a baseline panel is the best choice and should be combined with a complete blood count and urinalysis to complete the minimum database.

Comprehensive Diagnostic Profile (CDP)

ALB, ALP, ALT, AMY, BUN, Ca, CRE, GLOB*, GLU, K⁺, Na⁺, PHOS, TBIL, TP

- Monitor hospitalized patients with one of the most comprehensive VETSCAN VS2 profiles, including potassium and sodium
- Phosphorus (PHOS) level aids in assessment of kidney disease, hydration status, calcium disorders
- Elevated levels of amylase (AMY) can indicate pancreatic or intestinal disease, dehydration or decreased renal clearance

Preventive Care Profile Plus (PCPP)

ALB, ALP, ALT, AST, BUN, Ca, CI-, CRE, GLOB*, GLU, K+, Na+, TBIL, TCO₂, TP

FT GT VAT

- Monitor hospitalized patients with one of the most comprehensive VETSCAN VS2 profiles, with full electrolytes, including chloride and acid-base status with TCO₂
- Additional hepatocellular enzyme with aspartate aminotransferase (AST)

ALB=albumin; ALP=alkaline phosphatase; ALT=alanine aminotransferase; AMY=amylase; AST=aspartate aminotransferase; BUN=blood urea nitrogen; Ca=calcium; Cl=chloride; CRE=creatinine; GLOB=globulin; GLU=glucose; K⁺=potassium; Na⁺=sodium; PHOS=phosphorus; TBIL=total bilirubin; TCO₂=total carbon dioxide; TP=total protein.

Specific chemistry profiles

Choosing the most suitable specific profile

Once an initial diagnosis has been made and/or treatment has begun, a more focused panel can be used for efficient and economical close patient monitoring. See the chart below for common case examples as a guideline to using the focused profiles listed.

Electrolyte Plus (EP)

CI-, K⁺, Na⁺, TCO₂

FT LA VAR

Indications of Use

• Monitor fluid therapy for hospitalized or anesthetized patients in routine or emergency situations

Case Examples

- Foal recovering from enterocolitis
- Anorexic cats
- Unstable Addisonian (hypoadrenocorticism) cases

Critical Care Plus (CCP)

ALT, BUN, CI-, CRE, GLU, K⁺, Na⁺, TCO₂

FT GT VAT

Indications of Use

- Hospitalized patient monitoring
- Monitoring for certain chronic conditions
- Can be considered for preanesthetic or during anesthetic procedures

Case Example

• Recheck panel for cases such as hypoadrenocorticism, diabetes and urinary tract disease

Kidney Profile Plus (KPP)

ALB, BUN, Ca, CI-, CRE, GLU, K⁺, Na⁺, PHOS, TCO₂

M a va

Indications of Use

Specifically designed to evaluate renal function:

- Monitor chronic or acute kidney disease
- Monitor patients with toxic exposure or who are taking medications potentially toxic to the renal system
- Monitor hypoadrenocorticism
- Diagnose or monitor urinary tract disease
- Screen for acid-base abnormalities

Case Examples

- Recheck cats with early, mid- or late-stage kidney disease
- Monitor cats treated for hyperthyroidism
- Recheck dogs with acute or chronic kidney disease
- Monitor dehydrated patient receiving intravenous fluids
- Monitor general anesthesia

Mammalian Liver Profile (MLP) ALB, ALP, ALT, BA, BUN, CHOL, GGT, TBIL

P Car var

Indications of Use

Specifically designed to evaluate liver damage and cholestasis:

- Monitor liver injury, disease and function
- Detect cholestasis/enzyme induction (ALP, GGT)
- Evaluate hepatic function:
- Liver product levels (ALB, BUN, CHOL)
- Bile acids (BA) to assess liver function and patients suspected to have portosystemic shunt (PSS)
- Monitor patients on potentially hepatotoxic medications

Case Examples

- Perform if elevated liver enzymes present on a baseline profile health screening (CDP, PCPP, PPII)
- Monitor elevated liver enzymes in otherwise healthy patient
- Monitor PSS post treatment
- Monitor chronic liver disease
- Monitor patient receiving chronic medications metabolized by the liver

T4/Cholesterol Profile (T4/CHOL) CHOL, T4

La Val

Indications of Use

- Screen for hypothyroidism in dogs
- Diagnose hyperthyroidism in cats
- Monitor drug, I-131 or thyroidectomy therapy

Case Examples

- Regular screening for senior cats, regardless of whether clinical signs are present
- Screening for cats with clinical signs, such as behavior change, weight loss, unkempt coat, gastrointestinal signs
- Monitoring treatment regularly for hyperthyroidism in cats
- Confirm resolution for cats treated with I-131 or thyroidectomy
- Screen dogs with clinical signs, such as weight gain, alopecia, lethargy
- Monitor treatment regularly for hypothyroidism in dogs 4 to 6 hours postpill and 6 to 8 weeks after starting treatment or change in therapy¹¹

CHOL=cholesterol; I-131=iodine-131; T4=total thyroxine.

Reference Intervals

Using TCO₂¹²

Beyond the basic chemistry panel

The use of TCO, with chemistry and electrolyte results can often help narrow down a patient's differential list, especially when combined with anion gap

The measurement of TCO₂ is another way to measure bicarbonate, the body's buffer. A TCO₂ value outside the reference interval (range) is equivalent to a bicarbonate level outside the normal interval.

If TCO₂ is abnormal, the clinician must determine:

- Whether a complete acid-base analysis is warranted in the case of a difficult or complicated diagnosis or a very ill patient (measurement of pH, pCO₂, HCO₃, anion gap, +/- base excess)
- Whether the patient could be treated based on TCO₂ alone if the cause for the abnormality is straightforward

Note: TCO₂ should always be interpreted considering history, signalment, physical examination, clinical signs and other laboratory data. Many other factors, including electrolytes, proteins, ketones, lactic acid, uremic acids and metabolites of ethylene glycol and HCO₃ can affect the acid-base status of the patient.

 HCO_3 =bicarbonate; pCO₂=partial pressure of carbon dioxide; pH=potential of hydrogen; TCO₂=total carbon dioxide.

When possible, interpret a low TCO_2 with Anion Gap= $(Na^+ + K^+) - (Cl - + TCO_2)$

An increased anion gap is most often seen with metabolic acidosis due to lactic, keto or uremic acids or the presence of other metabolites (eg, ethylene glycol).

- A decreased anion gap is uncommon
- Alterations in albumin concentrations can alter the anion gap

Profile selection

Common indications to consider:

Health screening: young adult/adult

Health screening: senior

Anesthetic screening: young adult/adult

Anesthetic screening: senior

Screening a sick patient

Monitoring fluid therapy

Monitoring renal patient

Diagnosing and monitoring hepatic patient

Monitoring endocrine disease

*Canine with clinical signs or senior feline. ⁺Can be used if a patient is not using phenobarbital and PHB is zero.

Reference Intervals

Responsible Patient Trending—**why perform**?

Due to biological variations, the best reference values are a pet's own diagnostic values over time, encompassing breed, age, sex and individual variation

- one value will be outside of the reference interval¹³
- on published reference values for chemistry and hematology¹⁴

Senior patients

- The common occurrence of physical exam and laboratory abnormalities in apparently healthy senior dogs and cats emphasizes the need for regular health screening, including regular laboratory testing^{15,16}
- Visit/exam frequency and testing recommendations should be based on patient's age, breed and lifestyle
- Senior and geriatric dogs and cats should be examined at least semiannually to allow for earlier intervention of chronic disease
- Regular testing at geriatric equine annual examinations assesses overall health and may help detect early signs of potentially serious disease, such as liver and kidney dysfunction or onset of metabolic disease¹⁷

• It is important to understand that most reference intervals represent results expected for 95% (19 of 20) of a healthy population, and therefore 1 of 20 healthy animals is expected to have a measured value outside of the reference interval⁴

- For example, on the Comprehensive Diagnostic Profile (CDP) rotor with 14 assays, there is a 51% chance that at least

• For these reasons, individual patient trending is more sensitive and better at detecting pathologic changes than reliance

Reference Intervals

Keys to patient trending success

The best practice is to monitor a patient on the same analyzer using the same analytical methods

Whenever comparing or trending analyte results, it is important to trend using best practices and responsible trending to have an apples-to-apples comparison. This practice includes:

- Using the same analyzer every time, where possible
- Performing the test in the same way (how many hours posttreatment, fasted, etc)
- Keeping in mind that different assays and instruments have reference intervals that may differ among analyzers and/or labs
- Performing a quality check or verifying with a different test methodology if a value does not match the clinical picture

What is responsible trending?

Responsible Trending[™], available only on the ZoetisDx online platform, focuses on showing test analyte results as a sequence of graphs. This visual format provides a clear story of each patient's trends in test results over time—with results from different instruments and Zoetis Reference Labs together but always relative to each analyte's reference interval on each instrument.

Test	Ref Range	Units	Graph	11/15/20 07:02 AM	05/18/21 07:02 AM	06/12/21 07:02 AM	08/01/21 07:02 AM	09/09 07:02
ALB	2.5-4.4	g/dL		3.5	3.6	4.1	3.7	4.4
ALP	20-150	U/L		29	191*	164*	115	30
ALT 🗘	10-118	U/L		86	374*	262*	121*	78

Note: It is imperative when comparing results between different analyzers or labs to interpret the analyte value with respect to the reference interval provided and not the raw number due to inherent methodology differences.

UA	N/A	N/A	N/A	N/A	N/A	2.5 - 13.3	N/A	mg/dL

Reference intervals are provided as a guideline for adults only. The most definitive normal values are those established for your patient population. Juvenile or neonatal reference values may deviate from these ranges. Animals should be fasted for 12 hours before sample is drawn. Test results should be interpreted along with patient clinical signs. *Rabbit samples: ALB recovery must be manually multiplied by 1.8. This will correct for the dye-binding affinity of the BCG dye used in the ALB assay. Reference intervals displayed reflect this calculation.

⁺Calculated value.

• Reference intervals (ranges) will not display for species other than canine, equine and feline unless preprogrammed as custom intervals • Verified species—such as avian, bovine, ferret and rabbit—will need to be manually preprogrammed into the VETSCAN VS2 to display, using the VETSCAN VS2 Reference Intervals chart below and on the following page.
